What is Reconciliation?

Reconciliation is the process of comparing two or more sets of data to ensure they match, and investigating any differences.

Reconciliation Scenario

Let us assume the following data points exist across two statements:

- **Source A:** Transaction ID TXN_99 | Amount: ₹5,000
- **Source B:** Transaction ID TXN_99 | Amount: ₹5,000

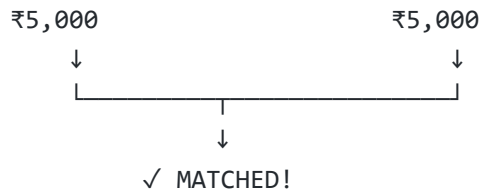

Result: **Matched** ✓

If **Source B** reflects ₹4,800, the system identifies a variance of ₹200. This record is then moved to an **Open** status for exception handling.

Your Bank Statement

Your Expense Tracker

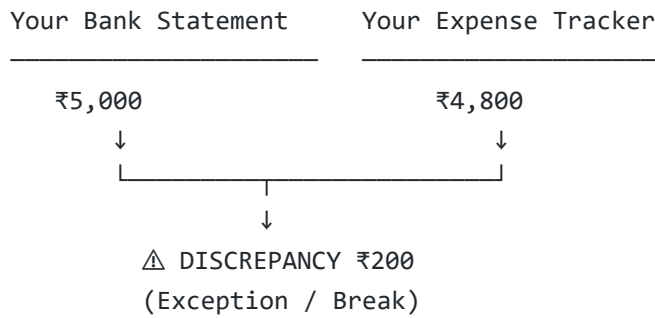

TEXT

When both numbers match, they are **reconciled** ✓

But what if they don't match?

TEXT

Now you have a **discrepancy** of ₹200 that needs investigation. This is an **exception** or **break**.

Why is Reconciliation Important?

Reason	Business Impact	ROI Indicator
Accuracy	Ensures financial records are correct and trustworthy, preventing costly errors in reporting	↓ Error rate by 95%
Fraud Detection	Identifies unauthorized transactions or anomalies early, reducing financial exposure	↓ Fraud losses by 70%
Regulatory Compliance	Banks and financial institutions are legally required to reconcile - avoid penalties	↓ Compliance risk
Decision Making	Accurate, timely data enables confident business decisions	↑ Decision speed by 3x
Audit Readiness	Clean, reconciled records with full audit trail simplify internal and external audits	↓ Audit prep time by 60%

What is ReconX?

ReconX is 3Cortex's intelligent reconciliation engine that automates the comparison and matching of data from multiple sources. Instead of manually comparing spreadsheets row by row, ReconX does it automatically in seconds.

The ReconX Advantage

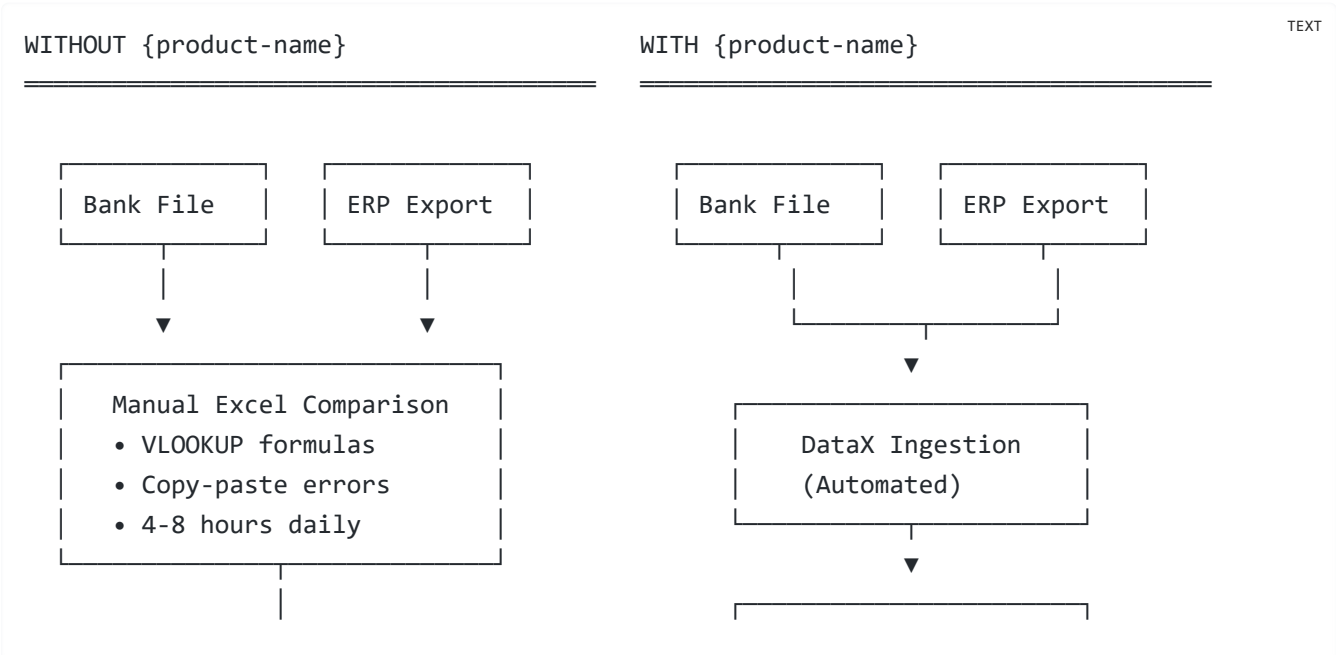

NOTE

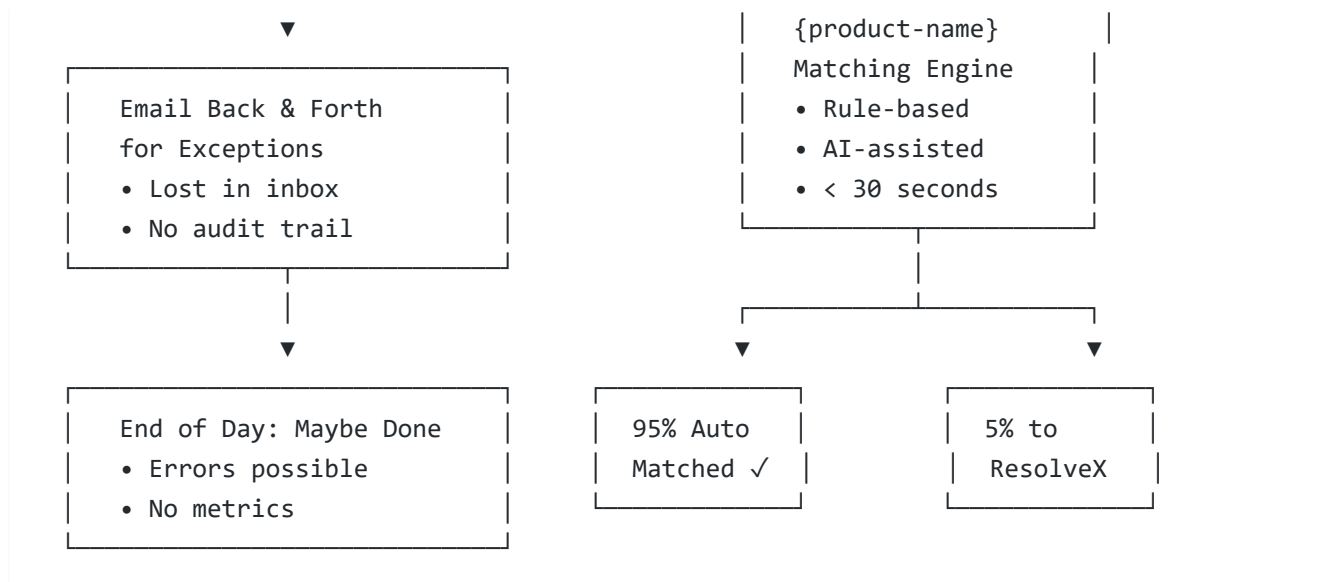

Industry Benchmark: Manual reconciliation typically takes 15-20 minutes per 100 records. ReconX processes 10,000+ records in under 30 seconds.

Key Capabilities

Capability	Icon	Business Value
Automated Matching		Compares thousands of records in seconds using configurable rules, reducing operational overhead by up to 80%
AI-Powered Suggestions		Machine Learning identifies likely matches even when data isn't perfect, increasing auto-match rates by 15-25%
Multiple Match Types	🔗	Supports 1-to-1, 1-to-many, many-to-1, and many-to-many matching for complex business scenarios
N-Way Reconciliation	🏢	Compare 3+ data sources simultaneously for multi-party settlement reconciliation
Rule Optimization	✍️	AI automatically tunes matching rules based on your data patterns
Exception Management	🚩	Routes unmatched items to ResolveX for structured investigation
Audit Trail	📜	Complete, immutable history of all matching decisions for compliance

Data Flow: Without vs With ReconX

| TIP

Quick Win: Most organizations see 70-85% auto-match rates on day one. With AI optimization, this typically increases to 90-95% within 2-4 weeks.

Architecture Overview

ReconX is designed as an intelligent, high-performance reconciliation engine that integrates seamlessly with the SAYA Platform.

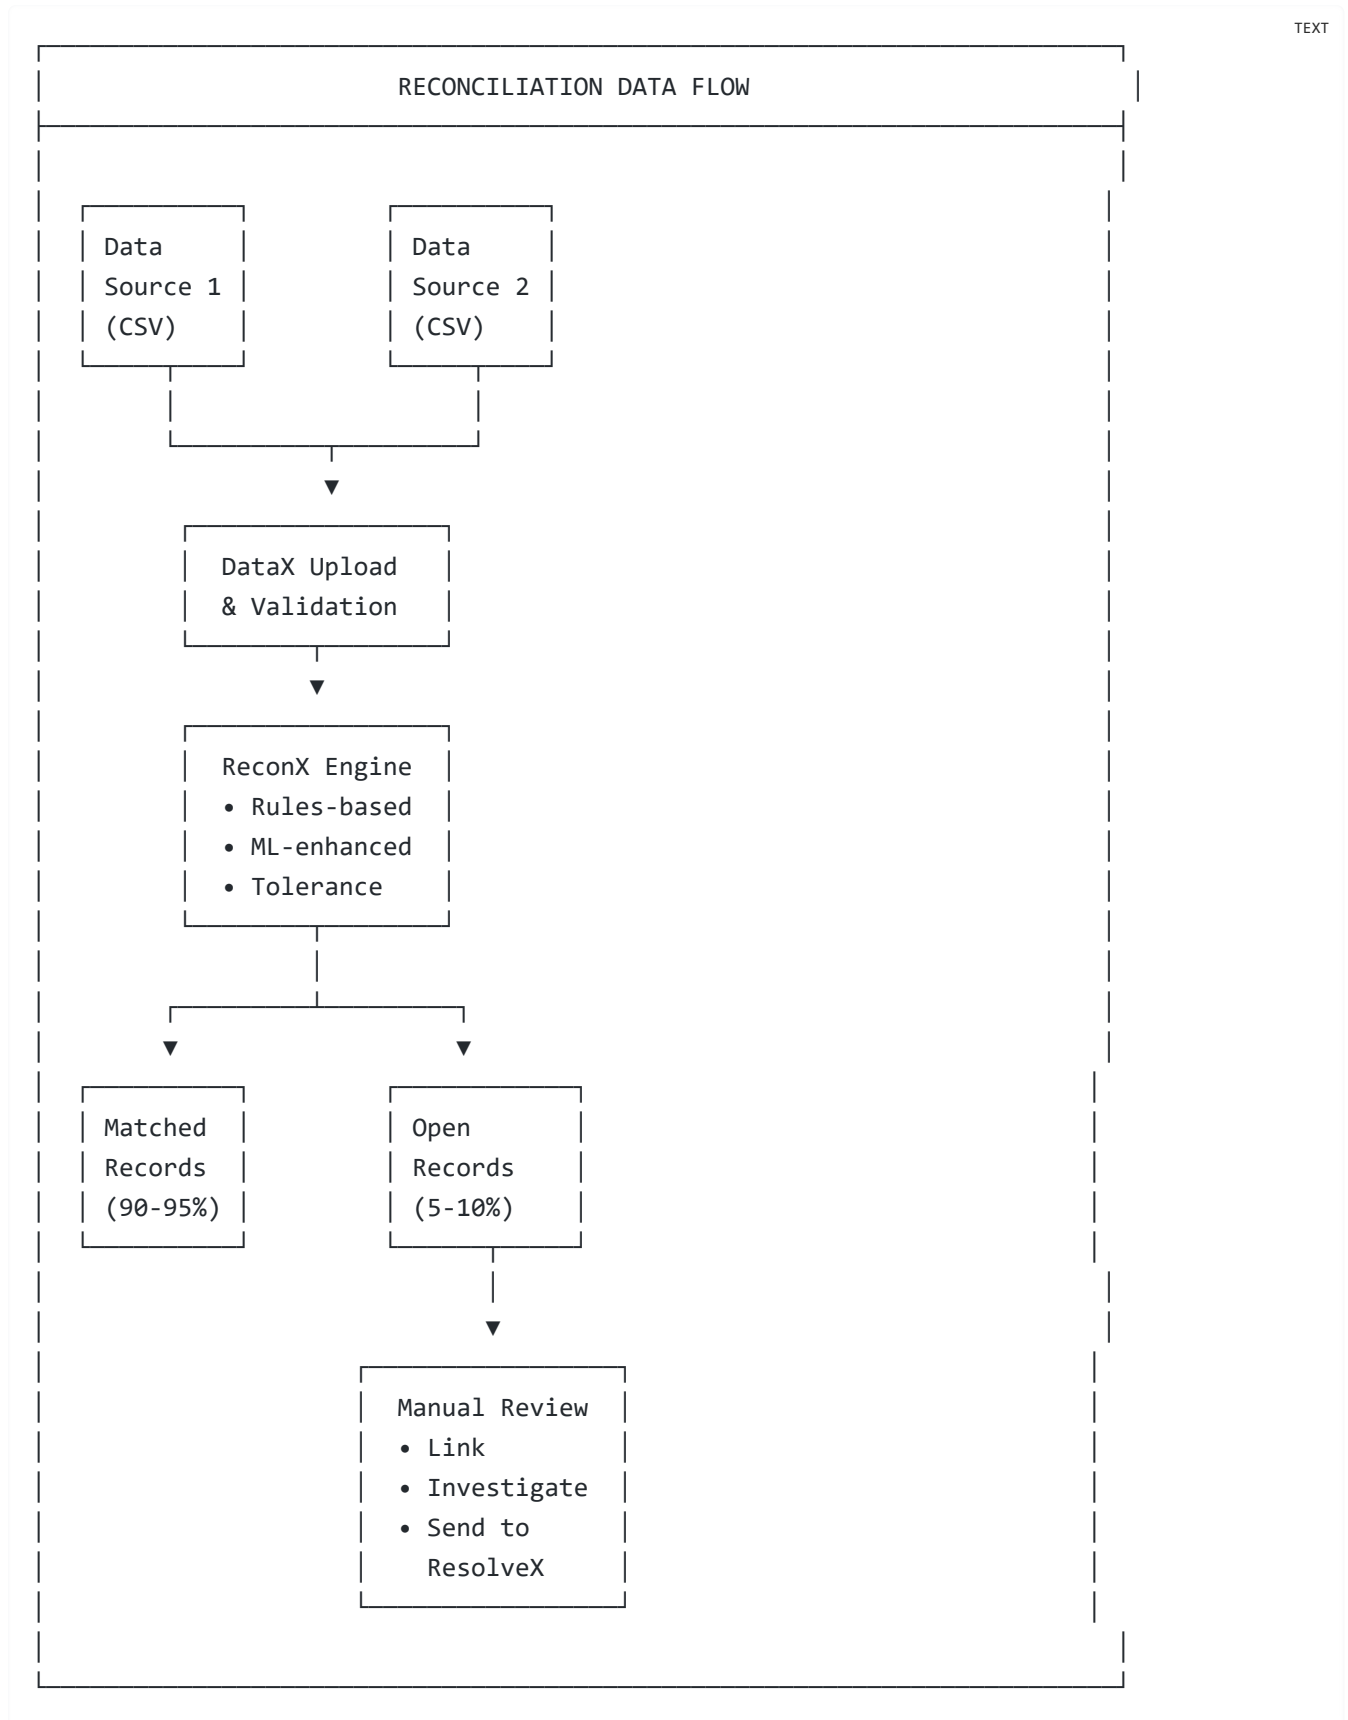

System Components

ReconX consists of:

- **Reconciliation Engine** - Core matching system supporting three algorithms:
 - **IN_MEMORY** - Traditional algorithm loading all records (best for <10K records)
 - **PARTIAL_FETCH** - Optimized algorithm with dynamic queries (best for >10K records)
 - **Multi-Match** - N-way matching across multiple data sources with aggregation support
- **Recon Optimizer** - AI/ML service that analyzes data patterns and automatically generates optimized matching rules
- **Autonomous Tolerance Calibrator (ATC)** - Machine learning component that computes optimal tolerance values by analyzing manual matching patterns with outlier removal
- **Workspace UI** - React-based user interface for daily operations, manual linking/delinking, and exception management
- **Integration Layer** - Connects to other SAYA modules:
 - DataX for data ingestion and preprocessing
 - ResolveX for exception workflow escalation

- PlatformX for authentication and authorization

Data Flow

Integration Points

ReconX integrates with other SAYA Platform modules:

- **DataX Integration**
 - Ingests CSV files via workspace upload or automated ETL
 - Validates data formats against Data Set definitions
 - Provides data preprocessing and transformation
- **ResolveX Integration**
 - Receives unmatched/exception records via "Send to ResolveX" action
 - Routes exceptions to configured workflows for investigation
 - Supports workflow-based resolution with approval chains
- **PlatformX Integration**
 - Authentication and authorization via SAYA IAM
 - Role-based access control (Operations User, Admin)
 - Department-based data segregation
 - Audit logging for compliance

Performance Characteristics

- **Throughput:** 10,000+ records reconciled in <30 seconds
- **Auto-Match Rate:** 70-85% day one, 90-95% with ML optimization
- **Algorithm Selection:** Automatic based on dataset size and configuration
- **Scalability:** Thread-pool-based parallel processing with grid partitioning

Prerequisites

Before using ReconX, ensure:

- **PlatformX Access:** User account with appropriate roles (Operations User or Admin)
- **Data Sources Configured:** Data Sets defined in Admin for the sources you want to reconcile
- **Data Files Ready:** CSV files with headers matching your Data Set column definitions
- **Ops Process Created:** At least one Ops Process linking your Data Sets (see Ops Process Configuration)

TIP

Don't have data yet? Use the sample CSV templates provided in the workspace to test reconciliation flows.

Getting Started

To get started with ReconX:

1. Configure Ops Process

Define which two data sources to compare. See Ops Process Configuration for step-by-step setup.

2. Upload Data

Upload CSV files for both data sources in the workspace. See Uploading Data for formats and validation.

3. Run Recon Optimizer

Let AI analyze your data and suggest matching rules. See Recon Optimizer for optimization steps.

4. Review & Adjust Rules

Fine-tune auto-generated rules or create custom matching criteria. See Recon Rules for rule configuration.

5. Execute Reconciliation

Click Reconcile and review matches/exceptions. See Reconciliation Process for daily operations.

For Administrators: Start with Steps 1-4 (configuration and rule setup) **For Operations Users:** Jump to Step 5 after admin completes initial setup

Who Should Use This Manual

Role	Focus Sections	Quick Start
Operations User	Workspace, Actions, Daily Operations	Jump to [Workspace]
Operations Manager	Monitoring, Reports, Team Performance	Jump to [How Rules Optimize Reconciliation]
Client Admin	Configuration, Rules, Optimization	Jump to [Configurations]
Fresher/New Joiner	Introduction, Terminology, Getting Started	Read sequentially from here
