# Troubleshooting

## Troubleshooting

No insights are visible

Actions

Dashboard does not load

Actions

Dashboard loads but shows missing data

Actions

Common Error Messages

Superset dashboard not found

Duplicate mapping

Invalid role or organisation

Guest token generation failed

Contacting Support

## No insights are visible

User logs in to SAYA and opens AnalytiX, but the insights list is empty.

### Actions

1. Confirm your organisation assignment in PlatformX (**Admin** > **Users** > view your user profile)
2. Confirm your assigned role(s) (**Admin** > **Users** > view your user profile > Roles tab)
3. Verify that at least one insight mapping exists for your organisation and role combination (**Admin** > **AnalytiX** > **Insight Mapping**)
4. If you recently changed organisations or roles, log out and log back in to refresh permissions
5. If no insights are visible and you expect to see dashboards, see [Contacting Support](#)

## Dashboard does not load

User can see the insight in the list, but clicking it results in a blank screen, error message, or infinite loading spinner.

### Actions

1. Check connectivity to the external analytics system:
  - Open the analytics platform directly (SAYA Dashboard Designer) and verify you can access it
  - If the analytics platform is down, dashboards cannot be embedded
2. Refresh the page and try loading the dashboard again (guest tokens may have expired)
3. Try loading a different insight to determine if the issue is specific to one dashboard
4. Check whether the dashboard still exists in the external analytics platform:
  - Log in to SAYA Dashboard Designer
  - Search for the dashboard by name or UUID
  - Confirm it is published (not in draft status)
5. If the issue persists after these checks, see [Contacting Support](#)

**NOTE**

Dashboards may take 10-30 seconds to load on first access while a secure guest token is generated and data is retrieved from the external platform.

## Dashboard loads but shows missing data

The dashboard renders successfully, but charts are empty, show "No Data", or display outdated information.

### Actions

- Validate the dashboard directly in the external analytics system:
  - Log in to SAYA Dashboard Designer
  - Open the dashboard there
  - Confirm whether data appears correctly in the source system
- If data is missing in the source system, the issue is with the dashboard configuration or data refresh schedules (not AnalytiX)
- If data appears in the source system but not in SAYA:
  - Confirm the dashboard has appropriate filters/permissions in the analytics platform
  - Check whether dataset refresh schedules are current
  - Review row-level security settings in the external platform
- If problem continues, see [Contacting Support](#)

## Common Error Messages

This section lists specific error messages and their resolutions.

## Superset dashboard not found

**Message:** "The dashboard could not be found" or similar error when attempting to configure an insight.

**Cause:** The specified dashboard does not exist in the external analytics system, or the service account does not have permission to view it.

**Resolution:**

- Ensure the dashboard exists in the external analytics system
- Confirm the dashboard is published and not in draft status
- Verify the service account has view permissions for the dashboard
- Check the dashboard UUID is correct

## Duplicate mapping

**Message:** "An insight with the same organisation and name already exists" or "Duplicate mapping detected."

**Cause:** An insight configuration already exists for the specified organisation with the same dashboard name.

**Resolution:**

- Check existing insight mappings for the organisation
- If updating access, edit the existing mapping instead of creating a new one
- If this is a different dashboard with the same name, the dashboard should be renamed in the external analytics system

## Invalid role or organisation

**Message:** "Invalid role ID" or "Invalid organisation ID."

**Cause:** The provided role or organisation identifier is not valid or does not exist in PlatformX.

**Resolution:**

- Confirm the organisation ID exists and is active
- Verify the role ID is valid for the specified organisation
- Ensure numeric IDs are provided (not names or other identifiers)
- Check user permissions to configure insights for the organisation

## Guest token generation failed

**Message:** "Unable to generate guest token" or dashboard embedding fails silently.

**Cause:** The system could not generate a secure embedding token for the dashboard.

**Resolution:**

- Verify connectivity between SAYA and the external analytics system
- Check service account credentials are valid and not expired
- Confirm the external analytics system API is responding
- Review application logs for detailed error messages
- Ensure the dashboard embedding feature is enabled in the external system

## Contacting Support

If the issue persists after following the troubleshooting steps, contact your support team with:

- The time the issue occurred
- Your username and organisation
- Which insight you were trying to access (insight name and ID if available)
- Screenshots of any error messages
- Steps you've already tried from this troubleshooting guide
