Workspace: Permission and Access Issues

Issue	Cause	Solution
Cannot see workflow	User role not mapped to workflow	Admin must add role to workflow
Cannot see queue	User role not mapped to queue	Admin must add role to queue
Cannot perform action	User role not mapped to action	Admin must add role to action
Actions dropdown not visible	Role not mapped to any actions for this workflow/queue	Admin must map role to at least one action for the workflow queue
Actions dropdown is empty	No actions configured for the selected queue, or role has no action access	Verify actions are added in Flow Designer and your role is mapped to them
Cannot delete workflow	Workflow used by Ops Process	Remove from Ops Process first
Cannot delete queue	Queue has items or is action target	Move items and update actions first
No items in queue	Wrong Ops Process/workflow/data source selected	Check dropdown selections
Notes section not visible	Notes not enabled for the workflow or role access is not granted	Admin must enable notes for the workflow and ensure your role can access it
Attachments section not visible	Attachments not enabled for the workflow or role access is not granted	Admin must enable attachments for the workflow and ensure your role can access it

Issue	Cause	Solution
Attachment upload fails	File too large or wrong type	Check file size (10 MB) and allowed types (PDF, TXT, JPG/JPEG, PNG, DOC, DOCX)

User Notes Required

When performing an action, you must enter **User Notes**:

- Required field
- Explains your decision
- Becomes part of the audit trail
- Helps others understand item history

Flow Designer Issues

Issue	Cause	Solution
Flow designer not loading	Browser compatibility, network error, or permissions	Check browser console for errors (F12), re-refresh page, clear browser cache, verify you have workflow access permissions
Flow designer shows blank screen	JavaScript error or missing workflow data	Open browser console (F12) to check for errors, verify workflow has queues configured, try different workflow
Nodes overlapping or hard to read	Complex workflow without auto-layout applied	Click Auto Layout button (tree icon) in toolbar to reorganize nodes using ELK algorithm
Cannot add rule or event edge	Source or target queue not selected, or permissions missing	Click on source queue node first to open panel, verify you have admin permissions, ensure rule/event exists
Edge not visible on flow designer	Edge outside viewport or zoom level too high	Use Fit View button (expand icon) to center workflow, zoom out using mouse wheel or – button
Changes not saving	Validation errors, required fields missing, or network timeout	Check browser console for validation messages, verify all required fields are filled, check network connectivity
Flow designer viewport scrolled beyond view	Initial zoom or layout positioning issue	Click Fit View button to reset viewport, adjust zoom with mouse wheel

Issue	Cause	Solution
Queue node icons not responding	JavaScript event handler conflict or permissions	Refresh page, check browser console for errors, verify you have queue edit permissions
Cannot drag nodes on flow designer	Node dragging disabled by design	Nodes are positioned by auto-layout algorithm - use Auto Layout button to reorganize instead of manual dragging

TIP

For large workflows, always use **Auto Layout** before making changes to ensure optimal node placement.

Rule Execution Problems

Issue	Cause	Solution
Rule not triggering	Rule expression syntax error or metadata field mismatch	Check rule in Admin > Rules for syntax errors (red indicators), verify metadata field names match ops process schema using <code>m.</code> syntax
Item not moving despite rule match	Rule mapping has no actions configured or actions misconfigured	Edit rule mapping in Flow Designer, verify <code>MOVE_QUEUE</code> action exists with valid target queue
Wrong queue destination	Multiple rules with same priority or rule expression incorrect	Review rule priorities in Admin > Rules (lower number = higher priority), test rule expression with sample data
Rule evaluation failed error	Invalid metadata field reference, type mismatch, or FEEL syntax error	Check audit log for detailed error message, verify field names exist in metadata schema, test FEEL expression syntax separately
Circular rule reference	Rule A references Rule B which references Rule A using <code>@r.</code> syntax	Review rule composition in Admin > Rules, identify circular dependency chain, remove one reference to break cycle
Rule matches but actions not executing	Backend service error or action configuration missing	Check application logs for errors, verify action IDs are valid, ensure target queue exists and is active
All items routing to same queue	Only one rule configured or first rule too broad (matches everything)	Review rule priorities, make most specific rules highest priority (lowest number), ensure rule expressions are mutually exclusive
Rule not evaluating new metadata fields	Metadata schema updated but rule still references old fields	Update rule expression to use new field names, verify metadata schema ID matches ops process configuration

WARNING

WARNING

First match wins - Rule evaluation stops after the first matching rule executes. Ensure higher-priority rules (lower priority numbers) are more specific than lower-priority rules.

Event Trigger Failures

Issue	Cause	Solution
TIME event not firing	Event not scheduled, Quartz scheduler stopped, or item moved before trigger	Check application logs for Quartz scheduler status, verify event mapping is enabled, confirm item was in queue at trigger time
CRON event firing at wrong time	Invalid cron expression, timezone mismatch, or system clock incorrect	Validate cron expression using online tool (crontab.guru), verify timezone in event configuration matches server timezone, check system time
Event actions not executing	Event mapping has no actions, API connectivity issue, or email service down	Edit event mapping to verify actions exist, check connector configuration for email/webhook services, review application logs
Batch notification empty	Filter rule excludes all items or queue empty at trigger time	Review filter rule condition, test with sample data, verify items exist in queue when CRON fires, check <code>lastEvaluatedAt</code> timestamp
Event window expired	Current date outside <code>startsAt/endsAt</code> range	Check event mapping date range in Flow Designer, update or remove date restrictions if event should still be active
Multiple TIME events firing	Item moved between queues multiple times creating multiple jobs	Review workflow logic, check Quartz scheduler job count, ensure old jobs are cancelled when item moves
CRON event not recurring	Quartz trigger deleted or event mapping disabled	Check event mapping enabled status in Flow Designer, review Quartz scheduler logs for trigger status
Event firing for moved items	No filter rule checking current queue, TIME event scheduled before move	Add filter rule to verify <code>s.queueId</code> matches expected queue, or accept that TIME events fire regardless of current location

NOTE

TIME events are scheduled when items enter a queue and fire even if items have moved. Use filter rules to check current queue if needed.

Navigation Issues

Issue	Cause	Solution
Cannot find Rules admin page	Permission not granted or menu item hidden	Admin must grant "rules" permission to your role, check under Admin > ResolveX > Rules
Cannot find Events admin page	Permission not granted or menu item hidden	Admin must grant "events" permission to your role, check under Admin > ResolveX > Events
Flow designer tabs (Actions/Rules/Events) not showing	Queue node not selected or permissions missing	Click on a queue node first to activate right panel, verify you have workflow edit permissions
Rule/Event mapping not visible in flow designer	Mapping created but flow designer not refreshed or rendering issue	Click workflow selector dropdown and re-select same workflow to refresh, use Fit View to check if edge is off-screen
Cannot access Flow Designer	Workflow edit permissions missing	Admin must grant workflow configuration permissions to your role
Right panel not opening when clicking icons	JavaScript event error or browser compatibility	Refresh page, check browser console (F12) for errors, try different browser (Chrome/Edge recommended)

Contacting Support

If issues persist after following troubleshooting steps, contact your support team with:

- The time the issue occurred
- The workflow and queue you were working in
- The specific action you attempted
- Any error messages or screenshots
- Your user role and permissions
