[Expected Business Outcomes](#)[Advanced: Multi-Threshold Rules](#)[Use Case 6: Credit Score-Based Loan Routing with Multiple Rules](#)[Business Context](#)[Solution Overview](#)

This page shows how to solve real business scenarios using ResolveX. Each use case provides practical steps for operating workflows in the ResolveX Workspace.

Use Case 1: Payment Dispute Workflow

Business Context

Banks and financial institutions receive customer disputes on payment transactions. These disputes require investigation, documentation, and resolution while maintaining compliance with regulatory requirements. Without structured workflow management, disputes get tracked in spreadsheets and email threads, leading to lost context, unclear ownership, and regulatory risk.

Solution Overview

ResolveX solves this by:

- **Structured Queue Management:** Disputes move through defined stages (New → Investigation → Approval → Resolution)
- **Role-Based Routing:** Analysts, customer service, and managers each work their assigned queues
- **Audit Trail:** All actions, decisions, and communications are logged for compliance
- **Integrated Communication:** Followup emails sent directly from the platform

Setup Required

You'll need to configure:

- **Workflow:** Payment Disputes Workflow with queues (New Disputes, Under Investigation, Pending Customer Response, Pending Approval)
- **Roles:** Dispute Analyst, Customer Service, Manager mapped to appropriate queues/actions
- **Actions:** Assign, Request Info, Approve Refund, Deny Claim, Approve, Reject
- **Features:** Enable Notes and Attachments for evidence capture; enable Followup for email communication

See [Configurations](#) for detailed setup instructions.

Workflow Design

Payment Disputes Workflow

└─ New Disputes (Entry point)

TEXT

Roles

- **Dispute Analyst** - New Disputes, Under Investigation
- **Customer Service** - Pending Customer Response
- **Manager** - Pending Approval

Operating Steps

1. Navigate to **Dashboard > ResolveX > Workspace**
2. Select the **Ops Process** and **Workflow**
3. In the queue tabs, start with **New Disputes**
4. Double-click a dispute record to navigate to the **Item Detail page**
5. Click the **Actions** dropdown menu in the detail page header
6. Select one of the available actions:
 - **Assign** → moves item to **Under Investigation**
 - **Reject** → moves item to **RESOLVED**
7. Enter **User Notes** explaining the decision (required)
8. Add supporting context from the detail page sections:
 - Add **Notes** (if enabled for the workflow)
 - Upload **Attachments** such as bank screenshots or customer correspondence (if enabled)
9. If you need information from a customer/team:
 - Use **Follow Up** email from the Actions dropdown (if enabled)
 - Move item to **Pending Customer Response**
10. Confirm the outcome:
 - Item moved to the target queue
 - Action and user notes appear in the Audit section

Expected Business Outcomes

After implementing this workflow, you should see:

- **Improved Accountability:** Each dispute has clear ownership via queue assignments and role mappings
- **Faster Resolution:** Average resolution time reduced through structured workflow stages
- **Audit Compliance:** Complete audit trail with user notes, actions, and timestamps for regulatory requirements
- **Better Visibility:** Queue counts and item status visible to supervisors and managers

Use Case 2: Reconciliation Exception Workflow

Business Context

Unmatched reconciliation items require investigation before being resolved or written off. These exceptions represent potential financial discrepancies that need analysis, documentation, and appropriate resolution. Manual tracking leads to lost items, unclear resolution criteria, and audit challenges.

Solution Overview

ResolveX solves this by:

- **Automated Exception Routing:** Unmatched items from ReconX automatically enter the workflow
- **Investigation Tracking:** Items move through analysis, approval, and escalation stages
- **Write-off Controls:** Financial write-offs require supervisor approval
- **Escalation Path:** Complex cases route to managers for resolution

Setup Required

You'll need to configure:

- **Workflow:** Recon Exceptions Workflow with queues (New Exceptions, Under Review, Pending Approval, Escalated Items)
- **Roles:** Recon Analyst, Supervisor, Manager mapped to appropriate queues/actions
- **Actions:** Investigate, Auto-Resolve, Match Found, Write Off, Escalate, Approve Write Off, Reject, Resolve, Return
- **Integration:** ReconX Ops Process configured to send unmatched items to ResolveX

See [Configurations](#) for detailed setup instructions.

Workflow Design

TEXT

Roles

- **Recon Analyst** - New Exceptions, Under Review
- **Supervisor** - Pending Approval
- **Manager** - Escalated Items

Operating Steps

1. Navigate to **Dashboard > ResolveX > Workspace**
2. Select the **Ops Process** and **Workflow**
3. Start with **New Exceptions**
4. Double-click an item to open item details

The screenshot displays the ResolveX application interface. At the top, there are dropdowns for 'Ops Processes' (set to 'TestRecon') and 'Workflow' (set to 'RECON EXCEPTIONS'). Below these, status counts are shown: 'OPEN - (2)', 'SEND TO ERP - (0)', 'POSTED - (0)', and 'RESOLVED - (0)'. A 'SEND GL Followup' button is visible on the right.

The main section contains a grid of input fields for transaction details:

TRANSACTION ID 122	ENTITY ENTERPRISE 1	POS COMP 1	BANK SRP BANK	BANK ACCOUNT 123456	CURRENCY KES
TRANSACTION DATE 22-Feb-24	TRANSACTION AMOUNT 1000	TRANSACTION TYPE Debit	PAYMENT GATEWAY VANTIV	REFERENCE 19925	PAYMENT TYPE CARD
E C O M CARD NUMBER 607448XXXXXX7802	PAY STATUS SUCCESS	RECON LINK ID	RECON STATUS ID 0	RECON NOTES	RAW DATA ID 516957
RECON UNIT ID 948	DATA SRC CONFIG ID 1	CASE STATUS OPEN	INGEST DATE 2024-11-30T00:00:00.000	LOGGED IN USER ID	

Below the grid, there is a section titled 'AUDIT INFORMATION FOR RESOLVE ID - 516957'. It contains a table with the following data:

WF AUDIT ID	USER NAME	ACTION NAME	QUEUE NAME	USER NOTES	CREATED DATE
1288	Rajendra	SSFI Registered	OPEN	Sent for Approval	2024-11-30T05:50:28.416+00:00

At the bottom right, there is a pagination bar showing 'Rows per page: 100' and '1-1 of 1'.

5. Investigate the record:
 - Review **Item Data** (original transaction fields)
 - Review **Audit** for past movements or decisions
6. Perform actions based on the outcome:
 - **Investigate** → move to **Under Review**
 - **Match Found** → move to **RESOLVED**
 - **Write Off** → move to **Pending Approval**

- **Escalate** → move to **Escalated Items**

7. Enter **User Notes** describing:

- what you checked
- why you chose that action

8. Attach evidence (if enabled): exports, screenshots, approvals

9. For approvals:

- Supervisor uses **Approve Write Off** or **Reject**
- Supervisor must enter **User Notes**

Expected Business Outcomes

After implementing this workflow, you should see:

- **Reduced Reconciliation Breaks:** Systematic investigation leads to identifying root causes
- **Controlled Write-offs:** All write-offs require supervisor approval with documented justification
- **Clear Escalation:** Complex cases route to appropriate authority levels
- **Audit Trail:** Complete history for financial audits and compliance reviews

Use Case 3: Simple Approval Workflow

Business Context

Certain items just need review and approval/rejection without complex multi-stage processing. Examples include expense approvals, document reviews, or simple authorization requests. A lightweight workflow reduces overhead while maintaining audit trails.

Solution Overview

ResolveX solves this by:

- **Streamlined Processing:** Two-queue design (Pending Review, On Hold) minimizes complexity
- **Quick Decisions:** Approve or Reject actions move directly to RESOLVED
- **Information Requests:** On Hold queue for items awaiting additional details
- **Simple Role Model:** Single Reviewer role handles all stages

Setup Required

You'll need to configure:

- **Workflow:** Simple Approval Workflow with queues (Pending Review, On Hold)
- **Roles:** Reviewer mapped to all queues and actions
- **Actions:** Approve, Reject, Need More Info, Resume

- **Optional Features:** Enable Followup for requesting additional information

See [Configurations](#) for detailed setup instructions.

Workflow Design

Roles

- **Reviewer** - All queues and actions

Operating Steps

1. Navigate to **Dashboard > ResolveX > Workspace**
2. Select the **Ops Process** and **Workflow**
3. Open **Pending Review** queue
4. Double-click an item to open details
5. Choose the decision:
 - **Approve** → RESOLVED
 - **Reject** → RESOLVED
 - **Need More Info** → On Hold
6. Enter **User Notes** (required)
7. If you selected **Need More Info**:
 - Use **Followup** email (if enabled) to request details
 - Add notes/attachments to record what information is missing (if enabled)
8. When the information is received:
 - Open **On Hold** queue
 - Double-click the item and use **Resume** to move back to **Pending Review**

Expected Business Outcomes

After implementing this workflow, you should see:

- **Fast Turnaround:** Simple two-queue design enables quick approval decisions
- **Reduced Backlog:** Clear process prevents items from getting stuck

- **Audit Compliance:** User notes provide justification for all decisions
- **Low Overhead:** Minimal configuration and role management required

Use Case 4: Creating Items Using Add Form

Business Context

Sometimes exceptions originate outside automated pipelines - received via email, phone calls, or manual reviews. Operations teams need to create workflow items directly in ResolveX to ensure these cases are tracked, worked, and audited like automatically-generated exceptions.

Solution Overview

ResolveX solves this by:

- **Manual Item Creation:** Add Form allows direct entry into workflows
- **Consistent Processing:** Manually-created items follow same workflow rules as automated ones
- **Document Attachment:** Supporting files can be uploaded during creation
- **Unified Audit:** Manual entries tracked with same audit trail as automated items

Setup Required

You'll need to configure:

- **Ops Process:** Configure metadata/form fields for manual entry
- **Workflow:** Link workflow to the Ops Process
- **Roles:** Grant Operations User role permission to create items
- **Form Fields:** Define required and optional fields for the Add Form

See [Configurations](#) for detailed setup instructions.

Roles

- **Operations User** - creates a new item using **Add Form**
- **Supervisor / Manager** (optional) - participates in later approval queues/actions depending on the workflow design

Operating Steps

1. Navigate to **Dashboard > ResolveX > Workspace**
2. Select the **Ops Process** and **Workflow**
3. Select any queue tab (the new item will be routed based on the workflow configuration)
4. Click **Add Form** (add item)

5. Fill in the required fields (marked with *)
6. If the form includes document fields, upload supporting files as configured for the form
7. Submit

The screenshot shows the 'Add TestResolveX Form' interface within the ResolveX application. The top navigation bar includes 'Ops Processes' (set to 'TestResolveX') and 'Workflow' (set to 'RECON EXCEPTIONS'). The form itself is titled 'Add TestResolveX Form' and contains several required fields marked with an asterisk (*):

- Name ***: Text input containing 'Rajiv'.
- Age ***: Text input containing '33'.
- ADDRESS PROOF * (pdf)**: Document upload field showing a file named 'Form8_s2909408C...'.
- DOB ***: Date input containing '08/27/1990'.

At the bottom of the form are two buttons: 'Submit' and 'Back'.

Expected Business Outcomes

After implementing manual item creation, you should see:

- **No Lost Cases:** All exceptions enter the system regardless of origin (automated or manual)
- **Consistent Tracking:** Manual entries follow same workflow rules and audit requirements
- **Complete Documentation:** Supporting documents attached at creation time
- **Unified Reporting:** Manual and automated items appear together in queue counts and reports

NOTE

If **Add Form** opens but shows no fields, the Ops Process may not have metadata/form fields configured.

Use Case 5: High-Value Transaction Auto-Escalation with Rules

Business Context

Financial institutions must route high-value transactions (over \$100,000) to manager approval for compliance and risk management. Manual triage is slow, error-prone, and doesn't scale. Without automation, transactions can be processed by unauthorized staff or slip through unreviewed.

Solution Overview

ResolveX solves this by:

- **Automatic Rule-Based Routing:** High-value transactions automatically move to Manager Review queue
- **Condition-Based Logic:** Uses FEEL expressions to evaluate transaction amounts
- **First Match Wins:** Rules evaluated in priority order for predictable routing

- **Zero Manual Triage:** Analysts never see high-value transactions, ensuring compliance

Setup Required

You'll need to configure:

- **Workflow:** Transaction Review Workflow with queues (New Transactions, Analyst Review, Manager Review, Approved)
- **Roles:** Transaction Analyst, Manager mapped to appropriate queues
- **Rule:** Create rule "High Value Requires Manager" with expression `m.amount > 100000`
- **Actions:** Standard approve/reject actions for each queue
- **Rule Mapping:** Link rule to "New Transactions" queue with MOVE_QUEUE action to "Manager Review"

See [Rules Configuration](#) for detailed setup instructions.

Workflow Design

Transaction Review Workflow

TEXT

Rule Configuration

Create rule in **Admin > ResolveX > Rules**:

- **Rule Name:** High Value Requires Manager
- **Rule Description:** Transactions over \$100K require manager approval per compliance policy
- **Metadata:** Transaction Processing Metadata
- **Rule Expression:** `m.amount > 100000`

Link rule in Flow Designer:

- **Source Queue:** New Transactions
- **Rule:** High Value Requires Manager
- **Priority:** 1 (highest priority)
- **Actions:** MOVE_QUEUE to "Manager Review"

ow designer showing green rule edge from New Transactions to Manager Review

Roles

- **Transaction Analyst** - Analyst Review queue only
- **Manager** - Manager Review queue and Analyst Review (for escalations)

Operating Steps

Automatic Processing (No User Action Required)

1. Transaction item enters "New Transactions" queue
2. Rule engine evaluates: `m.amount > 100000`
3. If TRUE:
 - Item automatically moves to "Manager Review"
 - Audit log records: "Moved by rule: High Value Requires Manager"
 - Manager sees item in their queue
4. If FALSE:
 - Item stays in "New Transactions"
 - Analyst manually moves to "Analyst Review"

Manager Approval

1. Navigate to **Dashboard > ResolveX > Workspace**
2. Select **Manager Review** queue
3. Double-click high-value transaction
4. Review transaction details and amount
5. Perform action:
 - **Approve** → moves to Approved → RESOLVED
 - **Reject** → moves to RESOLVED
6. Enter **User Notes** with approval justification

Expected Business Outcomes

After implementing rule-based routing, you should see:

- **100% Compliance:** All high-value transactions reviewed by managers
- **Faster Processing:** No manual triage delays
- **Reduced Risk:** Unauthorized staff cannot process high-value transactions
- **Clear Audit Trail:** Rule evaluations logged with metadata snapshots

- **Scalability:** Rules handle increasing transaction volumes without adding staff

Advanced: Multi-Threshold Rules

For more complex scenarios, create multiple rules with different priorities:

```
Rule 1 (Priority 1): m.amount > 500000 → Senior Manager Review
Rule 2 (Priority 2): m.amount > 100000 → Manager Review
Rule 3 (Priority 3): m.amount > 10000 → Team Lead Review
(Default): All other transactions → Analyst Review
```

TEXT

First matching rule executes, ensuring proper escalation hierarchy.

Use Case 6: Credit Score-Based Loan Routing with Multiple Rules

Business Context

Loan applications should route based on credit score thresholds: excellent credit (≥ 700) auto-approves, fair credit (600-699) requires manual review, poor credit (< 600) auto-rejects. Manual routing is inconsistent and leads to incorrect approvals or excessive manual work on obvious decisions.

Solution Overview

ResolveX solves this by:

- **Multi-Path Routing:** Three rules route to different queues based on score ranges
- **Priority-Based Evaluation:** Rules checked in order (auto-reject → manual review → auto-approve)
- **Consistent Decisioning:** Same criteria applied to every application
- **Reduced Manual Work:** Only borderline cases require human review

Setup Required

You'll need to configure:

- **Workflow:** Loan Processing Workflow with queues (New Applications, Manual Review, Auto Approved, Auto Rejected)
- **Roles:** Loan Officer for Manual Review queue
- **Rules:** Three rules for different credit score ranges
- **Rule Mappings:** Link all three rules to "New Applications" queue with priorities 1, 2, 3

See [Rules Configuration](#) for detailed setup instructions.

Workflow Design

```

Loan Processing Workflow
├── New Applications (Entry point)
│   ├── [Rule P1: Poor Credit] → Auto Rejected (automatic)
│   ├── [Rule P2: Fair Credit] → Manual Review (automatic)
│   ├── [Rule P3: Excellent Credit] → Auto Approved (automatic)
│   └── [Default] → Manual Review (if no rules match)
├── Manual Review
│   ├── Approve → Auto Approved → RESOLVED
│   └── Reject → Auto Rejected → RESOLVED
├── Auto Approved
│   └── Finalize → RESOLVED
└── Auto Rejected
    └── Close → RESOLVED

```

Rule Configuration

Create three rules in **Admin > ResolveX > Rules**:

Rule 1: Poor Credit Auto-Reject

- **Rule Name:** Poor Credit Auto-Reject
- **Rule Description:** Credit scores below 600 are automatically rejected
- **Rule Expression:** `m.creditScore < 600`

Rule 2: Fair Credit Manual Review

- **Rule Name:** Fair Credit Manual Review
- **Rule Description:** Credit scores 600-699 require loan officer review
- **Rule Expression:** `m.creditScore >= 600 and m.creditScore < 700`

Rule 3: Excellent Credit Auto-Approve

- **Rule Name:** Excellent Credit Auto-Approve
- **Rule Description:** Credit scores 700+ are automatically approved
- **Rule Expression:** `m.creditScore >= 700`

Link rules in Flow Designer:

Rule	Priority	Target Queue	Rationale
Poor Credit Auto-Reject	1	Auto Rejected	Check rejects first to avoid wasted processing
Fair Credit Manual Review	2	Manual Review	Middle range needs human judgment

Rule	Priority	Target Queue	Rationale
Excellent Credit Auto-Approve	3	Auto Approved	Best credit gets fastest path

low designer showing three green rule edges with different priorities

Roles

- **Loan Officer** - Manual Review queue only
- **System Administrator** - Auto Approved and Auto Rejected queues for reporting

Operating Steps

Automatic Processing (No User Action Required)

1. Loan application enters "New Applications" queue
2. Rule engine evaluates in priority order:
 - Priority 1: Check `m.creditScore < 600`
 - If TRUE → Move to "Auto Rejected", stop processing
 - If FALSE → Continue to next rule
 - Priority 2: Check `m.creditScore >= 600` and `m.creditScore < 700`
 - If TRUE → Move to "Manual Review", stop processing
 - If FALSE → Continue to next rule
 - Priority 3: Check `m.creditScore >= 700`
 - If TRUE → Move to "Auto Approved", stop processing
 - If FALSE → Stay in "New Applications" (edge case)
3. Audit log records which rule matched and metadata snapshot

Manual Review Processing

1. Navigate to **Dashboard > ResolveX > Workspace**
2. Select **Manual Review** queue
3. Double-click loan application
4. Review:
 - Credit score (600-699 range)
 - Loan amount
 - Employment history
 - Debt-to-income ratio
5. Perform action:

- **Approve** → moves to Auto Approved → RESOLVED
- **Reject** → moves to Auto Rejected → RESOLVED

6. Enter **User Notes** with approval/rejection justification

Expected Business Outcomes

After implementing multi-rule routing, you should see:

- **80%+ Auto-Decision Rate:** Excellent and poor credit apps route automatically
- **Faster Processing:** Loan officers only review borderline cases
- **Consistent Criteria:** Same thresholds applied to all applications
- **Compliance:** All decisions logged with rule evaluations
- **Workload Reduction:** Officers focus on complex cases requiring judgment

Advanced: Rule Composition

For more complex scenarios, combine rules using `@r.ruleId` syntax:

```
// Base rules
Rule: HighCreditScore = m.creditScore >= 700
Rule: LowDebtRatio = m.debtToIncomeRatio < 0.4
Rule: StableEmployment = m.employmentYears >= 2

// Composite rule
Rule: ExcellentCandidate = @r.HighCreditScore and @r.LowDebtRatio and @r.StableEmployment

// Use composite rule in workflow
Priority 1: @r.ExcellentCandidate → Auto Approved
```

TEXT

This improves maintainability by reusing simpler rules.

Use Case 7: SLA Breach Escalation with TIME Events

Business Context

Support tickets must be resolved within 2 hours or escalated to a supervisor. Manual monitoring is unreliable - staff forget to check timers, escalations happen late, and customers complain about slow response. Spreadsheet tracking doesn't scale and provides no audit trail.

Solution Overview

ResolveX solves this by:

- **Automatic Time-Based Escalation:** TIME event triggers 2 hours after ticket creation
- **Per-Item Scheduling:** Each ticket gets individual timer that fires independently

- **Notification + Move:** Event sends email to supervisor and moves ticket to escalation queue
- **No Manual Monitoring:** System handles SLA enforcement automatically

Setup Required

You'll need to configure:

- **Workflow:** Support Ticket Workflow with queues (New Tickets, In Progress, Escalated, Resolved)
- **Roles:** Support Agent, Supervisor mapped to appropriate queues
- **Event:** Create TIME event "2 Hour SLA Escalation" with duration PT2H
- **Event Mapping:** Link event to "In Progress" queue with MOVE_QUEUE + SEND_EMAIL actions
- **Email Template:** Configure escalation notification email

See [Events Configuration](#) for detailed setup instructions.

Workflow Design

Support Ticket Workflow

```

graph TD
    NT[New Tickets (Entry point)] --> SW[Start Work → In Progress]
    IP[In Progress] --> R1[Resolve → Resolved → RESOLVED]
    IP --> E1["[Event: PT2H] → Escalated (automatic)"]
    E[Escalated] --> R2[Resolve → Resolved → RESOLVED]
    R[Resolved] --> C[Close → RESOLVED]
  
```

TEXT

Event Configuration

Create event in **Admin > ResolveX > Events**:

- **Event Name:** 2 Hour SLA Escalation
- **Event Description:** Escalate tickets unresolved after 2 hours
- **Event Type:** TIME
- **Duration:** PT2H (2 hours)
- **Metadata:** Support Ticket Metadata

Link event in Flow Designer:

- **Queue:** In Progress
- **Event:** 2 Hour SLA Escalation
- **Action Scope:** ITEM (per-item execution)
- **Filter Rule:** (none - applies to all items)

- **Actions:**

- MOVE_QUEUE to "Escalated"
- SEND_EMAIL to supervisor with template "SLA Breach Notification"

Timeline showing ticket creation at 10:00 AM and automatic escalation at 12:00 PM

Low designer showing amber TIME event edge from In Progress to Escalated

Roles

- **Support Agent** - New Tickets, In Progress queues
- **Supervisor** - Escalated queue

Operating Steps

Normal Processing (Ticket Resolved Within 2 Hours)

1. Ticket enters "New Tickets" at 10:00 AM
2. Agent moves ticket to "In Progress" using "Start Work" action
3. Quartz scheduler creates job to fire at 12:00 PM (10:00 AM + PT2H)
4. Agent resolves ticket at 11:30 AM using "Resolve" action
5. Ticket moves to "Resolved" queue
6. Quartz job at 12:00 PM checks: Item no longer in "In Progress" queue → No action taken

SLA Breach (Ticket Not Resolved Within 2 Hours)

1. Ticket enters "New Tickets" at 10:00 AM
2. Agent moves ticket to "In Progress" using "Start Work" action
3. Quartz scheduler creates job to fire at 12:00 PM
4. Ticket still in "In Progress" at 12:00 PM (not yet resolved)
5. Quartz job fires:
 - Moves ticket to "Escalated" queue
 - Sends email to supervisor: "Ticket #12345 has breached 2-hour SLA"
 - Audit log records: "Moved by event: 2 Hour SLA Escalation"
6. Supervisor sees ticket in "Escalated" queue at 12:01 PM
7. Supervisor resolves ticket and enters notes explaining delay

Supervisor Review

1. Navigate to **Dashboard > ResolveX > Workspace**
2. Select **Escalated** queue

3. Double-click ticket to see:
 - Original creation time
 - Time spent in "In Progress"
 - Agent notes (if any)
4. Resolve ticket using "Resolve" action
5. Enter **User Notes** documenting resolution and cause of delay

Expected Business Outcomes

After implementing TIME event escalation, you should see:

- **100% SLA Compliance:** No tickets sit unresolved beyond 2 hours
- **Proactive Management:** Supervisors notified immediately when SLAs breach
- **Reduced Customer Complaints:** Faster escalation improves customer satisfaction
- **Clear Accountability:** Audit trail shows exactly when items breached SLA
- **No Manual Monitoring:** System handles timing automatically at scale

Advanced: Graduated Escalation

For multi-stage escalation, create multiple TIME events:

Event	Duration	Target Queue	Actions
Reminder	PT1H	(stays in queue)	SEND_EMAIL to agent (reminder)
First Escalation	PT2H	Escalated	MOVE_QUEUE + SEND_EMAIL to supervisor
Critical Escalation	PT4H	Critical	MOVE_QUEUE + SEND_EMAIL to manager

Each event operates independently, providing graduated pressure.

Use Case 8: Daily Review Reminder with CRON Events

Business Context

Pending approval queues accumulate items that sit unreviewed for days or weeks. Approvers forget to check the system, leading to backlogs and missed deadlines. Sending daily reminder emails manually is tedious and unreliable. The team needs automatic daily notifications with summary counts.

Solution Overview

ResolveX solves this by:

- **Scheduled Daily Reminders:** CRON event fires every morning at 9 AM
- **Batch Notifications:** Single email to approvers with all pending items
- **Zero Manual Effort:** Reminders send automatically without user intervention
- **Configurable Schedule:** Can adjust to business hours, weekdays only, etc.

Setup Required

You'll need to configure:

- **Workflow:** Approval Workflow with queues (New Requests, Pending Approval, Approved)
- **Roles:** Approver for Pending Approval queue
- **Event:** Create CRON event "Daily 9AM Review Reminder" with expression `0 9 * * *`
- **Event Mapping:** Link event to "Pending Approval" queue with SEND_EMAIL action
- **Email Template:** Configure batch summary email template

See [Events Configuration](#) for detailed setup instructions.

Workflow Design

Approval Workflow

TEXT

Event Configuration

Create event in **Admin > ResolveX > Events**:

- **Event Name:** Daily 9AM Review Reminder
- **Event Description:** Send daily email reminder to approvers with pending item count
- **Event Type:** CRON
- **Cron Expression:** `0 9 * * *` (9:00 AM every day)
- **Timezone:** America/New_York (or your business timezone)
- **Metadata:** Approval Request Metadata

Link event in Flow Designer:

- **Queue:** Pending Approval
- **Event:** Daily 9AM Review Reminder

- **Action Scope:** BATCH (all items in one email)
- **Filter Rule:** (none - include all pending items)
- **Max Batch Size:** 100 (or blank for unlimited)
- **Actions:** SEND_EMAIL to approver role with template "Daily Approval Reminder"

Email template preview showing summary of pending approvals

ow designer showing amber CRON event with schedule label

Roles

- **Requester** - New Requests queue
- **Approver** - Pending Approval queue

Operating Steps

Automatic Processing (No User Action Required)

1. Quartz scheduler triggers job every day at 9:00 AM
2. Job queries all items in "Pending Approval" queue
3. For each item:
 - Collect item ID, requester, submission date, description
4. Batch all items into single email payload
5. Send email to approvers with:
 - Subject: "Daily Reminder: You have 5 items pending approval"
 - Body: Table of pending items with details
 - Link to ResolveX Workspace
6. Update `lastEvaluatedAt` timestamp on event mapping
7. Audit log records: "Event executed: Daily 9AM Review Reminder, 5 items notified"

Email Content Example

Subject: Daily Reminder: You have 5 items pending approval

TEXT

Good morning,

You have 5 items in the Pending Approval queue that require your review:

ID	Requester	Submitted	Description
#12345	John Doe	2 days ago	Equipment Purchase Request
#12346	Jane Smith	1 day ago	Travel Authorization
#12347	Bob Wilson	3 days ago	Software License Renewal
#12348	Alice Brown	5 hours ago	Overtime Approval

| #12349 | Charlie Davis | 1 day ago | Budget Variance |

Click here to review: [Link to ResolveX Workspace]

This is an automated reminder sent daily at 9:00 AM.

Approver Review

1. Approver receives email at 9:00 AM
2. Clicks link to ResolveX Workspace
3. Selects **Pending Approval** queue
4. Reviews and processes items:
 - Double-click item
 - Perform "Approve" or "Reject" action
 - Enter **User Notes** with decision rationale
5. Items move to "Approved" or "RESOLVED"
6. Next day's reminder will not include processed items

Expected Business Outcomes

After implementing CRON event reminders, you should see:

- **Reduced Backlog:** Daily reminders keep approvers engaged
- **Faster Turnaround:** Average approval time decreases
- **Improved Visibility:** Approvers always know pending item count
- **Proactive Communication:** No manual reminder emails needed
- **Configurable Frequency:** Adjust schedule to business needs (daily, weekly, etc.)

Advanced: Filtered Notifications

For targeted reminders, add filter rules to only notify on specific conditions:

High-Priority Items Only

- **Filter Rule:** `m.priority == "HIGH"`
- **Result:** Daily email only includes high-priority pending approvals

Items Over 2 Days Old

- **Filter Rule:** `s.createdDate < date(now()) - duration("P2D")`
- **Result:** Daily email only includes items pending > 2 days (aging report)

Specific Departments

- **Filter Rule:** `m.department == "Engineering"`
- **Result:** Daily email only includes engineering approvals

Create multiple CRON event mappings on same queue with different filter rules and recipients to send targeted reminders to different approver groups.

Use Case 9: Batch Notification with Filtering

Business Context

Operations managers need daily summaries of high-priority cases only, without being flooded with low-priority items. Manual filtering and sending summaries is time-consuming. The team needs automated daily reports that show only items meeting specific criteria (e.g., priority level, dollar amount thresholds, or specific statuses).

Solution Overview

ResolveX solves this by:

- **Filtered Batch Processing:** CRON event with filter rule targets specific items
- **Smart Notifications:** Only items matching criteria included in summary
- **Reduced Noise:** Managers see relevant items, not entire queue
- **Configurable Criteria:** Filter rules can be adjusted without code changes

Setup Required

You'll need to configure:

- **Workflow:** Operations Workflow with queues (Active Cases, Escalated, Resolved)
- **Roles:** Operations Manager for Escalated queue
- **Rule:** Create filter rule "High Priority Items" with expression `m.priority == "HIGH"`
- **Event:** Create CRON event "Daily High Priority Summary" with expression `0 17 * * 1-5 (5 PM weekdays)`
- **Event Mapping:** Link event to "Escalated" queue with filter rule and `SEND_EMAIL` action

See [Rules Configuration](#) and [Events Configuration](#) for detailed setup instructions.

Workflow Design

TEXT

```

└─ [Event: 0 17 * * 1-5 + Filter] → (sends filtered batch email)
└─ Resolved
    └─ Close → RESOLVED

```

Rule Configuration (Filter Rule)

Create rule in **Admin > ResolveX > Rules**:

- **Rule Name:** High Priority Items
- **Rule Description:** Filter for high-priority cases only
- **Rule Expression:** `m.priority == "HIGH"`

NOTE

This rule is used as a **filter rule** in event configuration, not as a routing rule. It determines which items are included in the batch notification.

Event Configuration

Create event in **Admin > ResolveX > Events**:

- **Event Name:** Daily High Priority Summary
- **Event Description:** Send end-of-day summary of high-priority escalated cases
- **Event Type:** CRON
- **Cron Expression:** `0 17 * * 1-5` (5:00 PM Monday-Friday only)
- **Timezone:** America/New_York (or your business timezone)
- **Metadata:** Operations Case Metadata

Link event in Flow Designer:

- **Queue:** Escalated
- **Event:** Daily High Priority Summary
- **Action Scope:** BATCH (all matching items in one email)
- **Filter Rule:** High Priority Items (only items with `m.priority == "HIGH"`)
- **Max Batch Size:** (blank - include all matching items)
- **Actions:** SEND_EMAIL to operations manager with template "High Priority Daily Summary"

Event link dialog showing filter rule selection for High Priority Items

Roles

- **Operations Specialist** - Active Cases queue
- **Operations Manager** - Escalated queue (receives daily summaries)

Operating Steps

Automatic Processing (No User Action Required)

1. Quartz scheduler triggers job every weekday at 5:00 PM
2. Job queries all items in "Escalated" queue
3. Apply filter rule: Only items where `m.priority == "HIGH"` included
4. Example: Queue has 10 items, but only 3 are HIGH priority
5. Batch the 3 matching items into email payload
6. Send email to operations manager with:
 - Subject: "Daily High Priority Summary: 3 items requiring attention"
 - Body: Table of high-priority escalated items
 - Link to ResolveX Workspace
7. Audit log records: "Event executed: Daily High Priority Summary, 3 of 10 items notified"

Email Content Example

Subject: Daily High Priority Summary: 3 items requiring attention

TEXT

Operations Manager,

You have 3 HIGH-PRIORITY items in the Escalated queue:

ID	Assigned To	Days Open	Amount	Description
#12345	Sarah Lee	3 days	\$250,000	Wire transfer discrepancy
#12350	Mike Chen	2 days	\$180,000	Missing payment confirmation
#12355	Emma Davis	1 day	\$320,000	Account reconciliation break

Note: 7 additional LOW/MEDIUM priority items are also in Escalated queue (not shown in this summary).

Click here to review: [\[Link to ResolveX Workspace\]](#)

This summary is sent weekdays at 5:00 PM.

Manager Review

1. Manager receives filtered summary at 5:00 PM
2. Clicks link to ResolveX Workspace
3. Selects **Escalated** queue
4. Can see ALL items (HIGH, MEDIUM, LOW), but email highlighted the HIGH priority ones
5. Reviews high-priority items first:
 - Double-click item
 - Assess situation
 - Provide guidance or resolve

- Enter **User Notes**

6. Returns next day to address medium/low priority items

Expected Business Outcomes

After implementing filtered batch notifications, you should see:

- **Targeted Communication:** Managers see only relevant items, not entire queue
- **Reduced Alert Fatigue:** Fewer unnecessary notifications
- **Faster Response:** High-priority items get immediate attention
- **Flexible Filtering:** Can adjust criteria without code changes
- **Complete Visibility:** Managers can still access full queue when needed

Advanced: Multiple Filtered Notifications

Create multiple event mappings with different filter rules for layered communication:

Event	Filter Rule	Recipients	Schedule
Critical Cases Alert	<code>m.priority == "CRITICAL"</code>	VP Operations	Every 4 hours (0 */4 * * *)
High Priority Summary	<code>m.priority == "HIGH"</code>	Operations Manager	Daily 5 PM weekdays (0 17 * * 1-5)
Weekly Review	<code>m.priority in ["HIGH", "MEDIUM"]</code>	Department Head	Monday 9 AM (0 9 * * 1)

Each event operates independently with its own filter criteria and schedule.

Filter Rule Examples

Scenario	Filter Rule Expression
High-value only	<code>m.amount > 100000</code>
Aging items (>3 days)	<code>s.createdDate < date(now()) - duration("P3D")</code>
Specific status	<code>m.status == "PENDING_REVIEW"</code>
Multiple priorities	<code>m.priority in ["HIGH", "CRITICAL"]</code>
Complex criteria	<code>(m.amount > 50000 and m.priority == "HIGH") or m.vip == true</code>
